PRIVATE PROJECT · PROJECT BRIEF

StudyBuddy Planner

An AI-assisted study planner for engineering students

Author: Sushmita Honagekar | Status: Concept / private repository

1. The problem

Students often know what they have to study but not when or in what order. Exams, assignments and weak topics pile up, and a fixed timetable breaks the first time a day goes wrong.

2. The idea

StudyBuddy Planner takes a student's subjects, exam dates and self-rated weak topics, then builds a daily plan. When a session is missed, it re-plans the remaining days automatically instead of leaving a broken schedule.

3. Core features

- **Smart plan:** splits study time across subjects using exam dates and difficulty.
- **Auto re-plan:** moves missed sessions into the next free slots.
- **Focus timer:** Pomodoro-style sessions with short breaks.
- **Progress and streaks:** daily completion, subject-wise progress, streak badges.
- **Revision reminders:** spaced revision of topics already covered.

4. How it would work

Step	What happens
1 Input	Student adds subjects, exam dates, hours per day and weak topics.
2 Plan	The planner ranks topics by urgency and difficulty and fills the day.
3 Study	Student follows sessions with the focus timer and ticks them off.
4 Adapt	Missed or extra time changes the next days' plan.

5. Planned tech stack

React + Vite for the interface, Tailwind CSS for styling, Supabase for login and data, and a scheduling algorithm (priority scoring) for the plan. Hosting on Netlify.

6. Roadmap

- **Phase 1:** timetable input, manual plan, focus timer.
- **Phase 2:** auto-plan and auto re-plan logic.
- **Phase 3:** progress charts, streaks and reminders.

- **Phase 4:** installable mobile app (PWA) and sharing plans with friends.

7. Why the code is private

The repository is kept private while the planning logic is still in development. This document explains the idea and plan; code access can be shared on request.
